Need to build **Cobol-based applications** in a fraction of the time?   Then you need Netron's application development environment for building better systems   faster. Fusion rapidly delivers enterprise systems that are   *adaptive to change*   at lower risk.

                    "Having a frames-based system means that if we need to make our systems   available through different channels -- for example over the Internet --   we can easily use the same underlying technology. We just design the right   interface to bolt into the architecture."

 - Ian Gausden, Barclaycard
